

## 7.2 Means and Variances of Random Variables

examples:

What's the **average** # of moves from 1 spin?

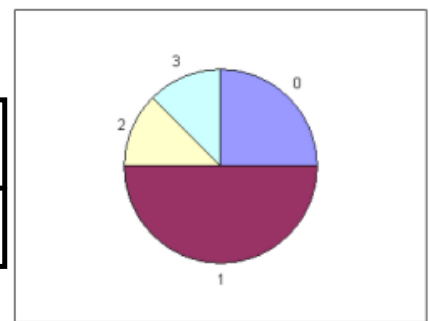

probability distribution:

Number of spaces to move X:

Probability:

0	1	2	3
1/4	1/2	1/8	1/8

**mean** (of all possible turns) =  
**expected value  $E(x)$**  for # of spaces in a turn is

**average** of a few observed spins is  $\bar{x}$ .

**Mean or expected value:**

$$E(x) = \mu_x = \sum x \cdot P(x)$$

Study: 

# of puzzles solved
3 minutes
distracting jackhammer sounds

X = # of puzzles completed & has this distribution:

X	0	1	2	3	4
P(X)	.3	.3	__	.1	.1

What is the mean  $\mu_x$  of X?

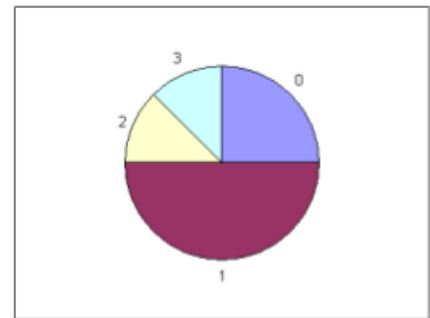

## Variance

- describes spread or variability in outcomes of X.
- weighted average of the squared deviations of the variable X from its mean  $\mu_x$ .

- $\sigma^2 = \sum [(x - \mu)^2 \cdot P(x)]$

$$(1/4)(0-9/8)^2 + (1/2)(1-9/8)^2 + (1/8)(2-9/8)^2 + (1/8)(3-9/8)^2 =$$

$$\begin{aligned} & (9/8)^2 * .25 + (1/8) \\ & 2 * .5 + (7/8)^2 * .125 \\ & + (15/8)^2 * .125 \\ & \quad \quad \quad .859375 \end{aligned}$$

Psychologist problem again:

X	0	1	2	3	4
P(X)	.3	.3	___	.1	.1

mean  $\mu$  of X = 1.4

variance  $\sigma^2$  of X = 1.64

What is the standard deviation  $\sigma$  of X?

$$\begin{aligned} & (0-1.4)^2 * .3 + (1-1.4)^2 * .3 + (2-1.4)^2 * .2 + (3-1.4)^2 * .1 + \\ & (4-1.4)^2 * .1 \\ & \qquad \qquad \qquad 1.64 \end{aligned}$$

pg. 411-413 questions 23, 25, 27, 29

$$\bar{x} \approx \mu$$

each SRS gives a different  $\bar{x}$  near  $\mu$ .

As  $n \Rightarrow$  the population size,  $\bar{x} \Rightarrow \mu$ .

This is **The Law of Large Numbers**

ex.

mean car odometer readings

mean # of TVs per home

pg. 416-417 31, 33

**example:**

Minutes to finish a test:  $N(40,3)$ . What is the probability a randomly selected student finishes in less than 38 min.?

$$P(38 < X < 42) =$$

There's a 0.15 probability that a randomly selected student takes more than \_\_\_\_ minutes.

3.4	.9997	.9997	.9997	.9997	.9997	.9997	.9997	.9997	.9997	.9998

## Transforming data

Conversion: *feet* • 12 = *inches*

**example:**

Some trees:  $\mu=120\text{ft.}$ ,  $\sigma=20\text{ft.}$ , &  $\sigma^2=$  \_\_\_\_\_

Describe  $\mu$  &  $\sigma$  in inches.

## Transforming data

Conversion:  $(^{\circ}\text{F}-32)(5/9)=^{\circ}\text{C}$

**example:**

June high temp somewhere:  $\mu=78^{\circ}\text{F}$ ,  $\sigma=2^{\circ}\text{F}$ , &  $\sigma^2=$ \_\_\_\_\_

Describe  $\mu$  &  $\sigma$  in  $^{\circ}\text{C}$ .

## Means

Rule 1: For linear transformations, transform the mean.

Rule 2: +, -,  $\times$ , or  $\div$  means as indicated.

## Variances

Rule 1: For linear transformations,  $\times$  by (factor)<sup>2</sup>.

Rule 2: For independent random variables,  
"The Pythagorean Theorem of Statistics" **add variances.**  
**NEVER add standard deviations!**

**example:** Psychologist problem again:

$\mu = 1.4$                       standard deviation  $\sigma = 1.28$

What are  $\mu$  and  $\sigma$  for the combined # of puzzles solved by 2 people?

**example:** mg of caffeine/serving for  
cola:  $N(52, \sqrt{3})$  & coffee:  $N(120, \sqrt{8})$ .  
Susan drinks 1 cup of coffee & 1 can of cola each morning.  
Find  $\mu$  &  $\sigma$  for mg of caffeine she consumes each morning.

What's the probability that she  
has over 175 mg of caffeine?

measurements in grams

Scale 1

X:  $N(2.000, 0.002)$

Scale 2

Y:  $N(2.001, 0.001)$

a. What are  $\mu$  &  $\sigma$  for  $Y-X$ ?

$X =$  result of one die roll     $\mu_X = 3.5$      $\sigma_X = 1.7$

Find the mean & standard deviation for...

$X+X =$  result  
of rolling 2 dice

$2X =$  result of  
rolling 1 die &  
doubling the  
answer

$D =$  result of  
rolling 2 dice &  
subtracting the  
results
